Plant Records

Records for publication must be submitted to the appropriate Vice-county Recorder (see BSBI Year Book 2003), and not to the Editors. Following publication of the New Atlas of the British & Irish Flora and the impending publication of the Vice-county Census Catalogue, new criteria have been drawn up for the inclusion of records in Plant Records; these will be published in BSBI News and will be followed in future issues of these lists. So, for the last time, the old criteria for inclusion of records are followed here (but with the addition of some casual taxa that are included in the two books mentioned above): Records must normally be of species, hybrids or subspecies of native or naturalised plants (listed in Kent (1992) or Stace (1997)), belonging to one or more of the following categories: 1st or 2nd v.c. record; 1st or 2nd post-1930 v.c. record; only extant v.c. locality, or 2nd such locality; a record of an extension of range by more than 100 km. Such records will also be accepted for the major islands in v.c. 102-104, 110 & 113. Only 1st records can normally be accepted for Rubus, Hieracium Taraxacum and hybrids. Records for subdivisions of vice-counties will not be treated separately; they must therefore be records for the vice-county as a whole. Records for Taraxacum must normally be additional to those in Dandelions of Great Britain and Ireland by A. A. Dudman & A. J. Richards (1997).

Records are arranged in the order given in the List of vascular plants of the British Isles and its supplements by D. H. Kent (1992), from which the species' numbers, taxonomy and nomenclature are taken. Taxa not in that book follow New Flora of the British Isles Ed. 2 by C. A. Stace (1997). The Ordnance Survey national grid reference follows the habitat and locality. With the exception of collectors’ initials, herbarium abbreviations are those used in British and Irish herbaria by D. H. Kent & D. E. Allen (1984). Records are field records if no other source is stated.

Records from the following vice-counties are included in the text below (superscript figures indicate number of taxa): 1/1.1. Huperzia selago 35, Mons.: One plant on barish area of coal waste, W of Keepers pond, Bloreinge, SO250106, H. Wray, 2000. 2nd recent record.
